

EVENT-DRIVEN FLOW CONTROL
FOR A VERY HIGH-SPEED SWITCHING NODE

Abstract

A method for controlling the flows of data packets that
5 are switched or routed at nodes of high-speed communication
networks is disclosed. According to the invention, resource
metering units are assigned to resources shared between
devices of the switch or router e.g., shared memories or link
bandwidths. When the occupancy of a shared resource reaches a
10 predetermined threshold, an event is generated and transmitted
to devices sharing this resource. Furthermore, a periodic
refresh of the overall flow control information is performed
so that lost events are, however, eventually acted on. Thus, a
new device may become active without perturbing the active
15 flows after having gathered enough flow control information.
